

Statistical Analysis of project 2

- Data is sparse , only 7 years have visitor counts out of 17 editions. The median visitor count of 1,000,000 reflects the Vision 2030 era dominance in the available data.
- Publishers' data is more complete (12 data points). Growth from 120 in 1978 to 2,000 in 2024 represents a 1,567% increase over 46 years.
- The visitor decline (-32%) is misleading: the 2011 outlier of 3M visitors skews the pre-Vision average upward. Median visitors pre-Vision = 911,639 vs post-Vision median = 1,000,000 , showing actual growth.
- The Vision 2030 era delivered a 26% annual growth in publishers.
- Publishers and Countries show moderate positive correlation ($r = 0.553$) , which means more publishers attract more international participation. Visitors and Publishers show a weak negative correlation ($r = -0.331$), but this is distorted by the 2011 outlier (3M visitors with only 700 publishers).
